

Connor Sweet

Software Developer | Full-Stack Applications and Systems Integration

@ connor.s.sweet@gmail.com in /connorsweet /connorssweet connorsweet.ca

Work Experience

Full-Stack Software Developer

ParkCo

February 2026 – Present

- Built a Node.js integration with third-party parking enforcement systems using SOAP/XML workflows to synchronize transaction data across distributed services
- Improved backend reliability across payment, permissions, and bulk-upload APIs by replacing unhandled failures with structured error responses and resolving defects in production workflows
- Developed a Python proof of concept for a Raspberry Pi controller with reusable hardware abstractions, priority-based queue scheduling for real-time tasks, and structured error handling
- Supported Docker services on AWS ECS, ECR, RDS, and CloudWatch, handling deployments, rollbacks, environment configuration, and production troubleshooting

Robotics Software Developer

Lincoln Electric Automation

July 2023 – January 2026

September 2022 – December 2022 (Co-op)

January 2022 – April 2022 (Co-op)

- Developed production features for a TypeScript, Vue, Node.js, and Babylon.js application used to program and operate industrial welding robots
- Designed a system to translate user-taught actions into executable welding instructions across Fanuc and ABB robot controllers
- Created a data migration workflow that converted persisted weld parameters to a revised schema while maintaining compatibility with existing jobs
- Maintained CI pipelines and build scripts to validate and package releases for Fanuc, ABB, and simulated controllers
- Implemented coordinate transformations across reference frames, enabling coordinated motion between industrial robots and external rotary positioners
- Added automated regression tests for program generation, data transformations, and controller-specific workflows before release

Software Developer Co-op

Client Outlook / Mach7 Technologies

2019 – 2021 (Three Co-op Terms)

- Developed Dart and JavaScript APIs for external applications to control an embedded clinical imaging viewer through the browser postMessage API
- Built Java and JavaScript tooling to automate frame-rate testing and collect rendering-performance metrics within a clinical imaging viewer

Skills

Languages

Python TypeScript JavaScript
Java SQL C++ C

Frameworks & Technologies

PostgreSQL Node.js Django
Express MongoDB REST APIs
Docker AWS Jest
Vue.js React

Education

BASc: Honours Computer Engineering - Artificial Intelligence Option

University of Waterloo

2017 – 2023

- Graduated with Distinction
- Elected Class Academic Representative
- Member of Waterloo Mars Rover and Robotics teams

Projects

Indoor GPS Navigation System

University of Waterloo Capstone

- Developed a Django backend with PostgreSQL to store and retrieve map data for multiple buildings and floors
- Built React Native mapping for rooms, hallways, and points of interest from uploaded floor plans and GPS coordinates
- Application included indoor positioning, obstacle detection, and accessibility features for visually impaired users

Shapley Routing Python API

- Developed a Python API to calculate fair ride-sharing costs using exact Shapley values
- Implemented an approximation algorithm for larger participant sets and automated tests covering edge cases
